These data include age-adjusted rates, which allow us to make fairer comparisons among groups with different age distributions. For example, a group having a higher percentage of older adults may have higher death or hospitalization rates because older adults are more likely to die or to be hospitalized. **Rate estimates for small groups (those having fewer than 20 people) may be unstable and should be interpreted with caution.**

*Rate estimates for groups having fewer than 20 people may be unstable; values for those groups are not shown in the chart above.
