

URSMD SHARED RESOURCE LABORATORIES AND FACILITIES SUMMARY

Overview and environment: The University of Rochester School of Medicine and Dentistry (URSMD) is committed to providing and supporting Shared Research Laboratories (SRL) and Shared Research Resources (SRR) to support the research mission of the URSMD investigators in basic, translation and clinical research. These facilities cut across all departments and centers, and in 2012 were brought together under central leadership and administration. Over the last 6 years, the SRL and SRR have been a key component of the URSMD strategic plans. This can be highlighted by the continued subsidized support of the operation of these facilities, (~\$1.6 million for FY2017 [excluding an additional ~\$400,000 annual Animal Resource subsidy]), as well as a major commitment to support the acquisition of new instrumentation and resources, highlighted by over \$1M commitment of new resources and renovation of lab space from over the last five years. Leadership: Timothy Bushnell, Ph.D., Director of Shared Resource Laboratories

New equipment and research enhancements: In the past several years, using a combination of institutional commitment and grant support, the URSMD Shared Resources have seen significant improvements and enhancements of the tools available to support the research mission. These recent enhancements include:

- 2014 - Acquisition of a Q-Exactive Plus for the Mass Spectrometry Resource Laboratory
- 2014 - Official Establishment of the Pathways Discovery Resource, including a new Perkin Elmer Zephyr compact liquid handling workstation and genome-wide RNAi library
- 2014 - Awarded \$500K from New York State for research equipment to the Health Sciences Center for Computational Innovation
- 2014 - Acquisition of next-generation Linux cluster ("BlueHive") for Center for Integrated Research Computing
- 2014 - Genomics Research Center acquired a ABI QuantStudio 12k FLEX real-time PCR instrument with funds from a Finger Lakes Regional grant proposal to replace an aging instrument and to provide high throughput digital PCR capabilities.
- 2014 - Completion of VISTA Collaboratory (visualization center) for Health Sciences Center for Computational Innovation
- 2014 - Genomics Research Center acquired a Sage Science Pippin DNA size fractionation system with funds from a Finger Lakes Regional grant proposal to enhance micro RNA research workflows.
- 2015 - Genomics Research Center awarded NIH S10 (PI: S. Gill) for purchase of a Fluidigm C1 Single-cell AutoPrep instrument.
- 2015 - Genomics Research Center purchased EpMotion 5075 liquid handling system to be dedicated for NGS library preparation.
- 2016 - Mass Spectrometry Resource awarded NIH S10 (PI: Ghaemmaghami) for the payout of the Lease on the Q-Exactive Plus.
- 2016 - NIH S10 grant (PI: Williams) for the acquisition of an XSTRAHL Small Animal Radiation Research Platform (SARRP) and the creation of the Model Imaging and Tomotherapy Facility, a new URMC Resource supported by the Wilmot Cancer Institute.
- 2016 - Acquisition of a second Illumina MiSeq to enhance the Genomics Research Center capacity
- 2016 - Genomics Research Center founds a Bioinformatics analysis group to provide analytical and research support for investigators using genomic approaches
- 2017 - Genomics Research Center enhances single-cell genomics capability through purchase of a 10X Genomics Chromium Controller from internal UR investigator collaborations
- 2017 - Genomics Research Center hires Technical Scientist dedicated to custom genomics applications, including single-cell genomics
- 2017 - NIH S10 grant (PI: Butler) for the acquisition of a Typhoon FLA 9500 for the Molecular Imaging Facility
- 2017 - Acquisition of the Olympus FVMPE-RS multiphoton scanning system with two excitation lasers and a Gantry Frame to expand live animal imaging capabilities.
- 2017 - Appointment of Dr. Kaye Thomas as the Technical director of the Confocal Microscopy Resource
- 2017 - Appointment of Dr. Yurong Gao as the Technical Director of the Multiphoton Resource.

2018 – Acquisition of the Illumina Novaseq6000 with internal funds to enhance the Genomics Research Center.

2018 – NIH S10 grant (PI: Yule) for the acquisition of an Abberior STED microscope for the Center for Light Microscopy and Nanoscopy

2018 – NIH S10 grant (PI:Ghaemmaghami) for the acquisition of a ThermoFisher Fusion Lumos Tribrid Mass Spectrometer for the Mass Spectrometry Resource.

2018 - Acquisition of a Bio-Rad S3e cell sorter for the Flow Cytometry Resource with funds from the Wilmot Cancer Institute

2019 – Acquisition of the Agilent Seahorse XFe96 Analyzer for the Flow Cytometry Resource with funds from the Environmental Health Sciences Center.

2019 – Institutional support for the acquisition of a FEI 120kEV cryoEM system for the Electron Microscopy Resource. Anticipated arrival April, 2020.

2019 – Institutional support for the acquisition of a Cytec Aurora Spectral Analyzer for the Flow Cytometry Resource. Anticipated arrival January, 2020.

2019 – New York State Grant (PI: Land) for the acquisition of a Nikon A1R scanning confocal microscope with TIRF for the the Center for Light Microscopy and Nanoscopy.

2019 - New York State Grant (PI: Land) for the acquisition of a 10x Genomics Chromium Controller, a Covaris E220 focused ultrasonicator and an Illumina NextSeq 550 sequencing system for the Genomics Research Center

Additionally, the UR Clinical Translational Research Institute (CTSI), the Center for AIDS Research (CFAR) and the Rochester Human Immunology Center have provided critical and incremental support to multiple research resources.

Shared Resource Laboratories

The UR Medical Center has a number of successful core research facilities that provide services to all researchers at the Medical Center. These facilities are listed below.

- **Center for Advanced Light Microscopy and Nanoscopy.** This resource provides UR researchers the ability to obtain high quality imaging data using state-of-the-art microscopy instruments. It also serves as one of the information hubs for UR resources centering around histological processing, imaging, and image processing and as a conduit for communication between imaging researchers on campus. Substantial one-on-one guidance is provided for obtaining and assessing high quality, quantifiable image-based data for each instrument. Staff also is continuously available for updating and discussing results in real time. Specialized instrumentation includes Confocal: Two Laser Scanning Confocal Microscopes (LSCM) are available with experimental capabilities including: 3-dimensional (z-stack), and 4-dimensional (z-stack with timelapse or multi-point timelapse) data acquisition, multiple FRET applications (sensitized emission, acceptor photobleaching, spectral FRET). The Nikon A1R HD LSCM is equipped with 6 laser lines and both Galvano and Resonant scanners for rapid imaging of live samples. The Nikon is also equipped for TIRF and single molecule imaging. The Olympus FV1000 LSCM which is configured with lasers spanning the blue to far red spectrum. A SIM scanner provides the additional capability for synchronized continuous imaging during photo-manipulation experiments such as FRAP and optogenetic experiments such as photoactivation and photoswitching. Laser Capture Microdissection: A Palmbeam (Zeiss) laser-capture microdissection microscope equipped with multiple long working distance objectives and both brightfield and immunofluorescence capabilities is available. STED Microscope: The Abberior Instruments easy3d STED system offers variable 2D to 3D STED imaging and aberration correction via adjustment of a Spatial Light Modulator (SLM) for maximizing resolution in thick samples or samples with non-standard refractive indices for STED imaging of up to 3 colors. Our system is equipped with the RESCue STED, DyMIN STED and MINFIELD STED modules for light dose management to reduce photobleaching and phototoxicity. Image Analysis Capabilities: The LM Shared Resource Image analysis software capabilities currently include: Imaris SF, NIS-Elements with deconvolution, FV1000 analysis software, FIJI/ImageJ2 and Amira. Director: Kaye Thomas, Ph.D.

- Electron Microscopy.** The principal mission of the Electron Microscopy Resource Laboratory is to provide University of Rochester researchers support in high magnification (**700 to 600,000x** range) for ultrastructural analysis of cells and tissue in the fields of Transmission Electron Microscopy (TEM), Scanning Electron Microscopy (SEM) and combined Scanning/Transmission EM (STEM). Specialized instrumentation includes a Hitachi 7650 III Analytical Scanning/Transmission Electron Microscope (STEM) with a side mount Gatan Erlangshen 11 megapixel digital camera, an electron dispersive x-ray spectrometer (EDAX Instrument) for elemental analysis of nanoparticles and a Gatan Digiscan II undermount camera for STEM mode imaging (brightfield and darkfield with fine probe elemental analysis) (TEM occupies 470 sq.ft). Auxiliary equipment includes a new (2011) Boeckeler P-XL ultramicrotome, 2 Olympus double headed light microscopes, a 45 year old Bausch & Lomb stereo dissecting microscope, various centrifuges, a new 2013 acquired Tousimis 931 automated critical point dryer (for SEM specimens), Leica glass knife breaker and several diamond knives for 70nm thin sectioning of epoxy blocks (wet bench space occupies 670 sq.ft). For SEM imaging, the EM Core utilizes a 2008 Zeiss Auriga field emission SEM/STEM housed in the Hajim Engineering School on the University's non-medical River Campus. Director: Karen Bentley, M.S.
- Flow Cytometry.** The mission of URM C Flow Cytometry Resource Laboratory is to provide investigators with state-of-the-art instrumentation along with the technical expertise to support all that is possible now, while pushing the limits of what can be done with flow cytometry. The Core currently has traditional analytical tools including an Accuri C6+ (4-colors) and 5 LSR-II's (one 12-color and four 18-color instruments) from BD Biosciences. The core also recently added a spectral flow cytometer, the Cytel Aurora, a 4 laser instrument capable of identifying near 30 fluorochromes simultaneously that includes the automated plate loader. We have three sorters available including a 17 and an 18 color FACS Aria-II and a 4 color BioRad S3e. In addition we have several non-traditional analytical cytometers. The Amnis ImageStream GenX allows for imaging flow cytometry and the detection of up to 10 fluorescent parameters with cellular localization information. The CyTOF Mass Cytometer, which came online late 2012, uses lanthanide metal mass spectrometry as opposed to traditional fluorescent tags, allowing the analysis of upwards of thirty parameters to be studied simultaneously. The resource also added the Nanosight NS3000 in 2015 for the detection of nano-sized particles. The Nanosight is capable of measuring the size distribution and concentration of particles as small as 10 nanometers by using light scatter and Brownian motion. Two other instruments available in the resource are the Celigo, a microwell plate-based imaging cytometer, and the Seahorse XFe96 for measuring metabolic function. Instrumentation is only part of what we offer. We also offer comprehensive training for staff, consultation for maximizing the effectiveness and cost of experiments, as well as an environment that fosters success in both existing methods and crossing the boundaries into new frontiers. Director: Timothy Bushnell, Ph.D.; Technical Director: Matthew Cochran, M.S.
- Genomics Research Center.** The UR Genomics Research Center (GRC) provides collaborative assistance with experimental design, execution, and data analysis for investigators using high-throughput next generation sequencing (NGS), genotyping and gene expression in their research programs. The GRC address rigor and reproducibility by incorporating several key quality assessment and quality control (QA/QC) point throughout standard operating procedures to ensure utmost quality performance. In addition, mycoplasma and cell line authentication analysis are available. Services include RNA-Seq, single-cell genomics applications, loss of function screening (RNAi or CRISPR), Bar-seq, ChIP-Seq, ATAC-seq, epigenomics (RRBS, WGBS, MeDiP, Methyl-seq), small RNA-Seq, repertoire sequencing, RIP-Seq, targeted and whole exome sequencing, whole genome sequencing, 16S rRNA microbiome sequencing, metatranscriptomics, metagenomics, sanger sequencing, qRT-PCR, Affymetrix microarrays, purification of RNA/DNA, nucleic acid amplification, as well as custom applications and approaches. In addition, GRC staff lead collaborative projects with URM C investigators to develop new methodologies and incorporate emerging genomic technologies into faculty research programs and the GRC workflow. Dedicated computational support for hardware, data analysis and storage of high-throughput sequence data is provided by the Center for Integrated Research Computing (CIRC). The following major equipment is located in the GRC: one Illumina NovaSeq 6000 high-throughput DNA sequencer, one Illumina NextSeq550 DNA Sequencer, two Illumina MiSeq DNA sequencers, one C1 Single-Cell Auto Prep System, two 10X Genomics Chromium Controller, two Sage

Science Pippin DNA size fractionation system, one QX100 Droplet Digital PCR System, one ABI QuantStudio 12K Flex Real-Time PCR System with autoloader and microfluidic card module, two ABI 9700 PCR machines, two BioRad DNA Engine PCR machines, six BioRad C1000 Thermocyclers, one Perkin Elmer SciClone liquid handling robot for NGS library construction, one Eppendorf 5070 liquid handling robot for qPCR setup, one Eppendorf 5075 liquid handling robot for library construction automation, one Covaris E220 sonication system, one Agilent 2200 TapeStation System, two Agilent 2100 Bioanalyzers, one Agilent Fragment Analyzer, one BioRad gel documentation system, one Qubit fluorometer and multiple NanoDrop ND-1000 spectrophotometers Director: Steven Gill, Ph.D.; Co-Director: John M. Ashton, Ph.D., MBA.

- **Mass Spectrometry Resource Laboratory.** The Mass Spectrometry Resource Laboratory (MSRL) provides instrumentation and technical expertise to UR researchers seeking to conduct MS-based protein or small molecule assays. Technicians within the MSRL provide assistance with project design and planning, proper sample preparation (sample clean-up, protein concentration, 1D gel electrophoresis, liquid chromatographic separations and proteolytic digestion) and interpretation of mass spectrometric data. Common analyses include the identification of unknown proteins, characterization of protein complexes, mapping of post-translational modifications (PTMs) and relative quantification of peptides and small molecules from a range of sample types, including complex clinical matrices, tissue extracts and cell lysates. Specialized MS instrumentation operated and maintained by the core include a Thermo Q Exactive Plus Hybrid Quadrupole-Orbitrap and a Fusion Lumos Tribrid mass spectrometer. In addition, the laboratory has access to a variety of automated database searching software as well as resources to facilitate discovery-based proteomics projects. Director: Sina Ghaemmaghami, Ph.D.; Technical Director: Kevin Welle
- **Multiphoton Imaging Resource.** The mission of the URM Shared Resource Laboratory is to provide state-of-the-art multiphoton imaging capabilities to further the biomedical and bio-optical research with emphasis on small animal intravital imaging and systems physiology. The Core is devoted to facilitating researchers with high quality quantitative imaging, and enhancing the chances of successful funding.
Multiphoton microscopy: The Multiphoton Core Facility is currently equipped with a state-of-the-art *Olympus FVMPE-RS Twin Lasers Imaging System*. The system uses a MaiTai HP DeepSee Ti:Sa laser and an Insight X3 laser as two laser sources to offer a wide range of excitation wavelength for various chromophore options as well as high imaging qualities. The FVMPE-RS system also has a high-speed resonant scanner and a galvanometer scanner to provide high speed as well as high definition imaging in a single system, flexible for both structure imaging as well as dynamic imaging. The system has four high-sensitive photomultiplier tubes (PMT) and multiple options of filter cubes specialized for multi-color imaging. The microscope is also capable of doing large image area tiling and stitching with high speed and resolution. Comparing to traditional one-photon microscope, the system has the advantage to be capable of imaging thick, highly light scattering biological tissues up to 500µm deep, and cleared tissue up to 2mm deep without tissue sectioning or fixing. The FVMPE-RS system combines high speed, deep observation capability with multi-color imaging, which will meet a myriad of experiment needs.
Animal Physiology: The Multiphoton Core facility supports animal intravital imaging and physiology studies by providing two fully outfitted surgical stations with Leica Surgical Dissecting Scopes for delicate surgeries, two Kent Scientific Isoflurane Vaporizers for animal anesthesia, two Transonic System Laser Doppler Flow Meters for blood flow measurements, a World Precision Instruments Pressure Monitor for blood pressure monitoring, and a Siemens RAPIDLAB Blood Gas Analyzer for blood gas and pH measurements.
Image Analysis: In conjunction with the Confocal Core, the Multiphoton Core facility provides access to a high performance analysis workstation with multiple image analysis software, including Imaris, Amira, Matlab, and ImageJ. The Multiphoton core staff members with expertise in data analysis routinely provide trainings on image analysis tools, support and consult on specialized analysis projects, and also collaborate with users to develop novel algorithms in-house. Director: Yurong Gao, Ph.D.

Other Research Resources

- **Animal Resource.** The Animal Resource is a centralized resource facility with staff and programs that support the research and educational uses of laboratory animals. These facilities are fully accredited by AAALAC, International and are in compliance with state law, federal statute and NIH policy. The Division of Comparative Medicine (DCM), formerly known as Division of Laboratory Animal Medicine (DLAM) consists of two board certified laboratory animal veterinarians, two additional laboratory animal veterinarians, & a staff of six trained and NYS licensed veterinary technicians. Support is provided for research with all major animal species. Services provided by DCM include colony health monitoring, quarantine services, animal acquisition from other research facilities, surgical support/anesthetic services, 24/7 on-call veterinary emergency services, clinical management of any cases of spontaneous or experimental disease, necropsy and histopathology services, training in specialized techniques (including inhalation anesthesia of all species, blood collection, aseptic surgical technique) and rodent breeding colony management for PIs. Core services provided by the Animal Resource include daily husbandry practices, daily observations for health problems, special request services (special diets, water, fasting), provision of federally mandated enrichment to animals, and cage wash, autoclave and room sanitation services. Major equipment includes HEPA filtered ventilated cages & hoods for barrier maintenance of SPF mice, "gnotobiotic mouse flexible film isolator units, dedicated BSL2 mouse housing & procedural space", inhalation anesthesia machines for rodents and large animals, diagnostic "digital" X-ray machine, autoclave for surgery packs, Intensive Care Unit, CO2 euthanasia stations, MRI capabilities and a Gammacell 40 Exacto Low Dose-rate Research Irradiator for irradiation of small animals within the resource (used principally in support of bone marrow transfer studies in mice). The UR Medical Center has recently expanded large animal (sheep, pig, cattle) surgical services with long term post-operative housing available at an AAALAC accredited sister institution located 35 minutes from the university. *Director: Jeffrey Wyatt, DVM*
- **Biosafety Level 3 (BSL-3) Facility.** The Biosafety level three facility (BSL-3) is available for the use of any researcher at the university whose work requires manipulation of biological agents which may cause serious or potentially lethal disease as a result of exposure by the inhalation route (such as TB). The BSL-3 Core laboratory is a fully self-contained facility and includes 4 biosafety cabinets, several incubators as well as -80 freezers and a liquid nitrogen storage tank. Additional equipment includes a tabletop centrifuge with high and low speed rotors, an inverted microscope (Olympus CK40), a sonifier, visible light spectrophotometer, electroporator, and cell lysis equipment. *Director: Martin Pavelka, Ph.D.*
- **Center for Integrated Research Computing (CIRC):** The UR established the Center for Integrated Research Computing (CIRC) to provide researchers across the University with technology, software, training, and support necessary to utilize high-performance computing (HPC) and big data technology fully in research activities in all areas of academic scholarship. CIRC presently supports faculty-led research projects from over 40 departments and centers across the Medical Center and River Campus. CIRC offers University researchers state of the art computing technology and software, and currently maintains about 550 teraFLOPS of high performance computing systems, including an IBM Blue Gene/Q system (see HSCCI, below). CIRC has over 4.5 petabytes of storage for data-intensive applications, and a variety of scientific software applications and tools.
 - CIRC's Linux compute cluster (known as "BlueHive") consists of approximately 400 nodes of IBM/Lenovo iDataPlex/NextScale and Dell high-performance computing servers with a high-speed, low-latency, 40 Gb/s FDR10 InfiniBand interconnect. Each node houses 2 x 18-core Intel "Broadwell" processors (for a total of 36 cores per node), 2 x 12-core Intel "Ivy Bridge" processors (for a total of 24 cores per node), or 2 x 20-core Intel "Skylake" processors (for a total of 40 cores per node) and ranges in memory from 64 GB up to 3 TB. 10 of the nodes contain 2 dedicated Nvidia K80 ("Kepler") GPU (graphics processing unit) cards that each provides 4,992 CUDA cores with 24 GB of GPU RAM per card for accelerated computing. 30 of the nodes have 2 dedicated Nvidia K20X ("Kepler") GPU cards that each provides 2,688 CUDA cores with 6 GB of memory. 2 of the nodes have 4 dedicated Nvidia V100 ("Volta") GPUs that each provides 5,120 CUDA cores with 16 GB of GPU RAM. 8 of the 64 GB nodes also have 2 dedicated Intel Phi 5110P accelerator cards, which provide an additional 60 cores and 8 GB RAM per card. The entire

BlueHive cluster has an InfiniBand-attached storage system that consists of 4 IBM/Lenovo GSS 24 system storage units providing approximately 4 PB of configurable raw disk within a parallel file system running IBM's enterprise GPFS software on a declustered array of disks. 3 PB is allocated to high performance scratch, and 1 PB has been made available for storage and archiving of files. A separate series of IBM DCS3700 storage shelves provide approximately 0.5 PB of redundant backup storage for the GSS units. Access controls and limitations are provided by file system ACLs (access control lists) to ensure appropriate security and authorized access to data. Approximately 182 compute nodes with varying capacity have been integrated into the BlueHive cluster for faculty investigators who have purchased additional priority-based compute capacity for the environment. CIRC runs the SLURM resource scheduler and queuing system to optimize usage and to support multiple users of the BlueHive Linux cluster environment.

- Supported developer tools in the BlueHive environment include C/C++ and Fortran compilers from Intel and GNU and math libraries from Intel (i.e. MKL). Parallel communications libraries are provided by Open MPI and MPICH2. Over 300 software packages for domain-specific scientific applications are also available. In addition, CIRC hosts numerous cross-domain scientific computing applications (e.g. R, Python, MATLAB, and Mathematica).
- The Center's efforts in collaboration, consultation, expertise, and community building are essential for facilitating the research mission of the UR. CIRC provides resources to faculty, staff, and students to ensure access to technology and knowledge necessary for effective computational research. These resources include technology (computer systems, software, storage, etc.), 9 full-time staff members (director, assistant director, 4 computational scientists, 3 system administrators), 3 part-time student research assistants, information sharing and collaboration tools, and an education and training program. Every summer, CIRC provides a six-week long program in training for computational and data science. Known as the "CIRC Summer School" this program is open to all University of Rochester faculty and students and provides hands-on, workshop-style training on a number of techniques and programming languages useful for developing tools and exploring research data. Past modules of the summer school include: Using Linux, Programming Python, Using Databases, Using MATLAB, and Data Analysis with STATA, SAS, and R. This program has recently expanded to include an offering in the winter months. Known as the "CIRC Winter Boot Camp," classes focused on programming and tools for data analysis are open to students, faculty, and staff at the University of Rochester. Director: Brendan Mort

- **Cold Storage Core (CSC).** The CSC provides a discrete controlled access area where investigators can maintain freezers for long-term storage of research materials. Each unit can be alarmed via data line to a central monitoring system (APOGEE), all units are power protected by emergency backup generators. Each unit receives semi-annual preventive maintenance, and CSC staff record daily temperatures. There are also spare units (4°C, -20°C, -80°C, and -140 °C) available to all URMCI investigators in case of emergencies. Director: Christopher Lane.
- **Health Sciences Center for Computational Innovation (HSCCI).** The UR recognized a growing need to improve support for Data Sciences related to biomedical research and has built state of the art infrastructure in response. Beginning in 2008 the UR created the HSCCI, a world-class center for the advancement of health-related research supported by high-performance computational (HPC) resources. The mission of the HSCCI is to facilitate collaboration among research faculty, computational biologists, programmers, and software developers to advance biomedical research. The Center will provide pilot funding for both research staff and HPC computational resources. The HSCCI is supported through a mix of corporate partnerships, direct institutional support, federal research grants, and state programs. The heart of the HSCCI is our BlueHive Linux Cluster which has 372 nodes, 8,972 cores, 44TB RAM, and 420 TeraFLOPS processing capacity and over 4.5 PetaBYTES of data storage. BlueHive is housed in University's new state-of-the-art, high-reliability, newly completed UR **Research Data Center (RDC)** and managed by the CIRC (see CIRC listing above). HSCCI research domains include projects concentrated in the following areas:

- Modeling Complex Biological Systems and Integration of Big Data: Vertical integration of multiple high-dimensional data sets from different levels of a complex biological system-incorporates genomics, microbiomics, proteomics, and organ-level data.
- Biomedical Imaging: Improved computational methods for analyzing images collected by a variety of technologies including MRI, ultrasound, and multiphoton microscopy. Includes development of analytical tools and computational methods for four-dimensional (3D over time) data.
- Molecular and Fluid Dynamics: Structural simulation and prediction of RNA, protein, and intermolecular interactions; fluid dynamics related to medical diagnostics and biological processes (eg. microfluidic devices and blood or air flow).
- Biomedical Informatics: Personalized medicine, mining Electronic Medical Records, perform virtual clinical trials

The HSCCI recently completed the construction of a state-of-the-art data visualization research lab - Visualization-Innovation-Science-Technology-Application (VISTA) Collaboratory. The mission of the VISTA is to provide collaborative space to house technology, research, and education in the data visualization sciences. Our approach is to bring together expertise in computer science, software, vision research, brain and cognitive sciences, statistics, and mathematics to work with experts in imaging, medicine, and biology to use, develop, and teach visualization technologies for large complex data. The VISTA houses an 8' x 20', 50 megapixel HD CineMassive display connected directly to the Blue Gene/Q and BlueHive supercomputers through a dedicated high speed, high bandwidth optical cable to the RDC. Executive Director: David J. Topham M.S., Ph.D.; Associate Director: Benjamin Miller, Ph.D.

- **Model Imaging and Tomotherapy Facility**: The new Model Imaging and Tomotherapy Facility offers researchers at the University of Rochester access to a Small Animal Radiation Research Platform (SARRP, Xstrahl) which allows delivery of radiation therapy protocols to animal models of human tumors through a means that is directly comparable to those used in current clinical practice. To this end, the SARRP is capable of delivering beams that make use of collimators varying from 0.5 mm to 10 cm, with an accuracy of 0.25 mm. Since this platform allows the generation of beams that can be rotated in directions ranging from vertical to 30° below horizontal, with 4-dimensional control over positioning of the model, recognized through the use of a laser-based positioning system, it provides flexibility for use in multiple applications and for diverse needs. The SARRP includes on-board cone-beam computed tomographic imaging, which is amalgamated with treatment planning and image fusion software. This component can be used independently as a small animal imaging device or, in conjunction with the dedicated dose planning system, can be used to generate individual conformal radiotherapy plans for preclinical studies or image fusion with other imaging data sets, including MR (any orientation) PET, etc. This technology is currently being developed to provide clinically-relevant protocols to a range of tumor models (brain, lung, pancreatic, bone), as well as investigate the development and prevention of post-therapeutic effects in normal tissues that affect cancer survivors, e.g. the bladder (cystitis), lung (pneumonitis and fibrosis), salivary glands (xerostomia), brain (necrosis; cognitive dysfunction), and post-therapy bone disease. Director: Jackie Williams, Ph.D.
- **Molecular Imaging Facility**. The Molecular Imaging Facility provides researchers at the UR with access to state of the art instruments capable of detecting and quantifying the levels and positions of radio- and fluorescently labeled molecules in a variety of formats including gels, blots and microtiter plates. Major instrumentation includes a Typhoon FLA 9500 (acquired in 2017). The Typhoon FLA 9500 is housed within the Center for RNA Biology, and handles gel sandwiches, agarose and polyacrylamide gels, membranes, microplates, and microarrays, with the capacity for multiplexed detection of chemiluminescence, fluorescence and ionizing radiation. Director: Scott Butler, Ph.D.
- **University of Rochester Center for Advanced Brain Imaging and Neurophysiology (CABIN) (Formerly Rochester Center for Brain Imaging – RCBI)**. The Rochester Center for Brain Imaging (CABIN) provides researchers at the UR, as well as neighboring institutions, with access to a state-of-the-art 3T scanner for research using magnetic resonance imaging (MRI). The Center is able to provide structural images of any part of the human body, functional imaging of the brain, and spectroscopy of living tissues. The heart of the CABIN is a recently upgraded Siemens Prisma 3T whole-body human

scanner, with maximum gradient amplitude of 80 mT/m and a slew rate 200T/m/s. A variety of RF coils are available for head, knee, and body imaging, including a 64-channel phased array head coil (capable of 3D parallel imaging) for brain studies. Pulse sequences installed on the Prisma system allow capability for many types of research applications, including high-resolution structural MRI (3D T1 and T2 weighted), functional MRI (BOLD fMRI), diffusion-weighted scans including diffusion tensor imaging (DTI - for imaging white matter tracts in the brain), blood vessel and perfusion imaging, single- and multi-voxel spectroscopy and MR elastography (MRE). The new capability for simultaneous multiple-slice (SMS) acquisition allows substantially faster and higher spatial resolution imaging for both structural and functional studies. Custom RF coils are available through the staff of the CABIN, permitting high resolution imaging of small animals. Active Master Research Agreement allows addition of new research capability from Siemens and world-wide researchers. Director: John Foxe, Ph.D.; Technical Director: Jianhui Zhong, Ph.D.

- **Rochester Human Immunology Center Core (RHIC).** The Rochester Human Immunology Center (RHIC) and its core laboratory are an important resource enabling clinical translational research. The RHIC was established to acquire, refine and develop expertise in cutting-edge techniques supporting applications in Human Immunology research and to provide quality management expertise for Good Research practices, GCP, GLP and regulatory compliance. The RHIC serves to enhance multi-disciplinary research initiatives catalyzing key clinical and basic immunology research in vaccines, HIV/AIDS, autoimmunity, allergy/asthma, transplantation as well as cancer immunology. The Center's core lab provides assistance and expertise in immunological method development, standardization and validation through individual and group training programs as well as collaborative projects through its fee for service cost center. The RHIC has served over 50 individual research projects over the past fifteen years, resulting in multiple new grant awards. The RHIC expertise covers techniques such as 18-color flow cytometry, 40 parameter CyTOF™ mass cytometry, multiplexed bead array assays (Luminex Xmap™), ELISPOT and EIA as well as quality and regulatory expertise in GLP and GCP for support of clinical translational research. The RHIC Core Lab also provides specimen processing and management, analytical and sorting flow assays and panel development, Luminex and ELISA assays on a fee for service basis. Director: Sally Quataert, Ph.D.
- **Small Animal Multispectral Imaging Core.** The Small Animal Multispectral Imaging Core offers state-of-the-art longitudinal multispectral (bioluminescence and fluorescence) imaging capabilities, to compliment and boost the extensive imaging resources available to University of Rochester Medical Center (URMC) researchers engaged in wide ranging areas of biomedical research with emphasis on clinical translation in alignment with the mission of the Clinical and Translational Sciences Institute (CTSI). The Core houses an IVIS® Spectrum system with unique capabilities for sensitively imaging both bioluminescent and fluorescent reporters within the same animal without mixing the multi-spectra. The system performs both epi- and trans-illumination fluorescent imaging and uses high efficiency narrow band-pass filters coupled with spectral unmixing algorithms to differentiate between multiple shallow and deep fluorescent sources. Director: Hani Awad, Ph.D.
