

Pediatric Occupational Therapy

“My son came to PM&R’s OT clinic after a brain hemorrhage and was unable to use his right arm, as well as suffering from aphasia due to the injury. I was so impressed how our therapist took the time to get to know my son on a personal level and was so patient throughout the entire process. Our experience was fantastic! We are so grateful to have the PM&R’s OT clinic in our lives.”

– Hilary Pieroni

For more information, or to schedule an appointment, please call **(585) 341-9000** or visit **PMR.urmc.edu**. We accept all insurances and have day and evening appointments available.

Free parking at our convenient location.

What is Pediatric Occupational Therapy?

UR Medicine Physical Medicine & Rehabilitation (PM&R)'s Pediatric Occupational Therapy Program treats children for a wide range of issues that affect their daily lives – difficulty tolerating the touch of clothing or eating age-appropriate foods, difficulty tolerating noisy environments, to fine motor coordination, learning and playing appropriately. We work together with physicians, parents and caregivers to develop a treatment plan designed to reach the child's maximum potential, step by step. Through evidence based practice, education, problem solving and encouragement, we achieve reliable results and greater satisfaction for everyone through our Patient- and Family-Centered Care (PFCC).

Conditions we treat

We are able to treat children with a variety of diagnoses, including but not limited to:

- ADHD/ADD
- Amplified musculoskeletal pain syndrome/RND
- Autism spectrum disorder
- Brachial plexus injury
- Burns
- Cerebral palsy
- Developmental delays
- Fine motor delays
- Hypermobility syndrome
- Hypotonia
- Juvenile rheumatoid arthritis
- Learning disabilities
- Motor incoordination
- Neuromuscular conditions
- Orthopedic injuries
- Sensory processing difficulties
- Traumatic brain injury

Treatment options

Our therapists will design an age-appropriate treatment program that addresses your child's exact needs. The program will be individualized with specific and attainable goals intended to improve functional performance. Some examples of evaluations and treatments provided by our therapists include:

- Activities of daily living – self-care, play skills, etc.
- Feeding and oral motor development
- Gross and fine motor development
- Neonatal and infant development
- Sensory integration
- Splinting
- Visual motor development

In addition, we will collaborate with other team members that are involved in your child's care.
