

The region's leader in the treatment of chronic venous insufficiency.

Venous insufficiency is a term that covers a wide range of vein related disorders, from relatively mild conditions like spider veins and ankle edema, to serious ones like deep vein thrombosis and venous ulcerations. More than 80 million Americans suffer from the effects of chronic venous insufficiency.

At the URM Heart & Vascular Center, we offer comprehensive patient care with state-of-the-art treatment options for chronic venous insufficiency. Individualized patient centric care is provided by highly trained and board certified vascular specialists. As a result, we provide patients the best opportunity for an excellent outcome.

The most comprehensive vein care in the region.

The URM Heart & Vascular Center has more office-based treatment options for the treatment of chronic

venous disease than any other center in the region. This allows us to better customize each patient's care.

These frequently performed office-based techniques are safe, durable and relatively pain free. As a result, URM has been designated a national training center of excellence by Covidien. Several of our vascular specialists are nationally known for their expertise in the treatment of chronic venous insufficiency.

- Anticoagulation
- Catheter-directed thrombolytic therapy
- Compression therapy
- Transcutaneous laser therapy
- EVLT® catheter ablation
- Ligation and stripping
- Micro stab phlebectomy
- Sclerotherapy
- Surgical bypass
- Valve repair and replacement
- Veinwave therapy
- Vena cava filters
- Venoplasty and venous stenting
- Venefit/Closure® technology

Patient- and Family-Centered Care.

Venous insufficiency is hereditary in most cases. So the URM Heart & Vascular Center works with patients and family members to develop a better understanding of how venous disease may affect their loved ones. We frequently treat multiple generations from a single family. By providing the widest range of therapies, we are able to individualize treatment options for each patient's unique set of circumstances. Our nationally funded basic science research laboratory is actively investigating the pathophysiology of chronic venous insufficiency.

MEDICAL CENTER

Conditions we treat.

The URMV Heart & Vascular Center treats all forms of chronic venous insufficiency. In many cases, regional hospitals send their most complex cases to us. Screening for chronic venous insufficiency is performed on site in our ICAVL accredited vascular laboratory. This noninvasive imaging is pain-free, quick and covered by insurance.

- Ankle and leg edema
- Chronic venous insufficiency
- Deep vein thrombosis
- Leg fatigue, aching and cramping
- Leg ulcerations
- Lymphedema
- May-Thurner Syndrome
- Nocturnal cramps
- Pelvic congestion syndrome
- Post phlebitis Syndrome
- Skin pigmentation
- Spider veins
- Thrombophlebitis (inflammation of the vein)
- Thoracic outlet syndrome
- Varicose veins
- Congenital arteriovenous malformations
- Venous malformations
- Venous aneurysms

One number for excellent care.
