Case 1

- 60 year-old man presents with abdominal pain
60 year old man w/ abdominal pain
Differential: Liver Lesions

- Cyst
- Abscess
- Primary neoplasm
- Metastasis
- Hemangioma
- Focal fat
Liver Metastases

- 2nd most commonly involved organ by metastatic disease, after lymph nodes
- Metastatic disease more common than primary
- Colon, stomach, breast, lung, and pancreas most common neoplasms to metastasize to the liver in adults
  - Calcified metastases occur with mucinous tumors of the breast, colon, and ovary
- Neuroblastoma, Wilm’s tumor and leukemia are the most common in children
- The majority of metastases are multiple; only 10% are solitary
Liver, Ultrasound-guided FNA: Diff-Quik stain, 20x
Liver, Ultrasound-guided FNA: Diff-Quik stain, 40x
Liver Ultrasound-guided FNA: Papanicolaou stain, 40x
Liver, right lobe, ultrasound-guided fine needle aspiration:

Malignant tumor cells present derived from adenocarcinoma.

Pancreatic endoscopic ultrasound-guided FNA 18 days prior was positive for malignancy, adenocarcinoma.
Pancreas, endoscopic ultrasound-guided FNA: Diff-Quik stain, 20x
Pancreas, endoscopic ultrasound-guided FNA: Papanicolaou stain, 40x
Pancreas, endoscopic ultrasound-guided FNA:
Cell block, H & E stain, 20x
Liver, right lobe, core needle biopsy:

Moderately differentiated adenocarcinoma consistent with pancreatic primary.
Liver, right lobe, biopsy: PASD stain, 20x
Pancreatic Adenocarcinoma

- EUS guided FNAs gaining recognition - obtain a pathologic diagnosis patients with pancreatic lesions (Advantage of this method detection of smaller lesions due to proximity of the probe)

- Pancreatic carcinoma ranks 4th in frequency of cancer deaths in North America

- Adenocarcinomas comprise 80-90% of malignant neoplasms of pancreas
Pancreatic Adenocarcinoma
Metastatic to Liver

- Cancer cells reach the liver through portal vein, hepatic artery, hilar lymphatics or by direct extension.

- Primary tumors of the gallbladder, extrahepatic bile ducts, pancreas and stomach frequently involve the liver by direct extension.
Case 2

- 69 year-old man with hiccups
69 year old man with hiccups
Differential: Hypermetabolic Rib Lesion

- Metastases
- Multiple myeloma
- Infection
  - TB
- Primary neoplasm
  - Benign: osteochondroma
  - Malignant: chondrosarcoma
Rib, left, 6th, CT-guided FNA: Diff-Quik stain, 20x
Rib, left, 6th, CT-guided FNA: Diff-Quik stain, 40x
Rib, left, 6th, CT-guided FNA: Papanicolaou stain, 20x
Rib, left, 6th, CT-guided FNA: Papanicolaou stain, 40x
Rib, left, 6th, CT-guided FNA: Cell Block, H & E stain, 20x
Rib, left, 6th, CT-guided FNA: Cell block, H & E stain, 40x
Rib, left, 6th, CT-guided fine needle aspiration:

Malignant tumor cells present derived from adenocarcinoma.

Cell block and cytologic preparations examined.
Esophagus, at 28 cm., biopsy:

Invasive adenocarcinoma, superficial biopsy.

Comment: Depth of invasion cannot be assessed with this small biopsy.
Esophagus, at 28 cm., biopsy: H & E stain, 10x
Metastatic Adenocarcinoma

- Metastatic carcinoma - prior clinical history is extremely important

- Compare surgical pathology with cytopathology specimen
Metastatic Esophageal Adenocarcinoma

- Patient’s with Barrett’s esophagus – relative risk of adenocarcinoma 30-120 fold in comparison with patient’s without
- Smoking factor – risk related to quantity and duration
- Abdominal obesity – risk factor, especially in men
- Time of diagnosis ~50% of patient’s have distant metastatic disease
Case 3

- 70 year-old smoker with shortness of breath. History of rheumatoid arthritis.
70 year old smoker w/ SOB. Hx RA
Differential: Solitary Pulmonary Nodule

- Neoplasm
  - Bronchogenic carcinoma
  - Hamartoma
  - Bronchial adenoma

- Infection
  - Septic embolus
  - Round pneumonia
  - Abscess
  - Granuloma

- CVD
  - Rheumatoid lung

- Congenital
  - Sequestration
  - Bronchogenic cyst

- Miscellaneous
  - Rounded atelectasis
# Fleischner Society Recommendations

### Recommendations for Follow-up and Management of Nodules Smaller than 8 mm Detected Incidentally at Nonscreening CT

<table>
<thead>
<tr>
<th>Nodule Size (mm)</th>
<th>Low-Risk Patient†</th>
<th>High-Risk Patient§</th>
</tr>
</thead>
<tbody>
<tr>
<td>≤4</td>
<td>No follow-up needed§</td>
<td>Follow-up CT at 12 mo; if unchanged, no further follow-up</td>
</tr>
<tr>
<td>&gt;4–6</td>
<td>Follow-up CT at 12 mo; if unchanged, no further follow-up</td>
<td>Initial follow-up CT at 6–12 mo then at 18–24 mo if no change</td>
</tr>
<tr>
<td>&gt;6–8</td>
<td>Initial follow-up CT at 6–12 mo then at 18–24 mo if no change</td>
<td>Initial follow-up CT at 3–6 mo then at 9–12 and 24 mo if no change</td>
</tr>
<tr>
<td>&gt;8</td>
<td>Follow-up CT at around 3, 9, and 24 mo, dynamic contrast-enhanced CT, PET, and/or biopsy</td>
<td>Same as for low-risk patient</td>
</tr>
</tbody>
</table>

---

Note.—Newly detected indeterminate nodule in persons 35 years of age or older.

* Average of length and width.
† Minimal or absent history of smoking and of other known risk factors.
§ History of smoking or of other known risk factors.
§§ The risk of malignancy in this category (<1%) is substantially less than that in a baseline CT scan of an asymptomatic smoker.
†† Nonsolid (ground-glass) or partly solid nodules may require longer follow-up to exclude indolent adenocarcinoma.
Lung, left, CT-guided FNA: Diff-Quik stain, 42x
Lung, left, CT-guided
FNA: Diff-Quik stain, 40x
Lung, left, CT-guided FNA: Papanicolaou stain, 20x
Lung, left, CT-guided FNA: Papanicolaou stain, 40x
Lung, left, Cell Block: Mucin stain, 40x
Lung, left, CT-guided fine needle aspiration:

Malignant tumor cells present derived from squamous cell carcinoma.

Cell block and cytologic preparations examined.

Comment: Immunohistochemical stains are positive for CK 5/6 and p63, negative for TTF-1 and napsin A. Mucin histochemical stain is negative. The results support the diagnosis of squamous cell carcinoma.
Squamous Cell Carcinoma of Lung

- Lung cancer leading cause of cancer deaths in men and women in U.S. and world
- Squamous cell carcinoma 2nd most common type of lung Ca (30%)
- Risk factors include tobacco use, asbestos, TB, COPD, radon and second hand smoke exposure
Almost there…
Case 4

45 year-old man with chest discomfort. History of rib resection in 2006 secondary to chondrosarcoma.
45 year old w/ chest discomfort. Hx of chondrosarcoma

T1 fat sat

T1 fat sat w/ c

T2 fat sat
Differential: Cystic Chest Wall Lesion

- Recurrent chondrosarcoma
- Abscess
- Seroma
- Hematoma
- Lymphocele
Chest, left anterior, CT-guided FNA: Diff-Quik stain, 10x
Chest, left anterior, CT-guided FNA: Diff-Quik stain, 20x
Chest, left anterior, CT-guided FNA: Papanicolaou stain, 10x
Chest, left anterior, CT-guided FNA: Papanicolaou stain, 20x
Chest, left anterior, CT-guided FNA: Cell Block, H & E stain, 20x
Chest, left anterior, CT-guided
FNA: Cell Block, H & E stain, 40x
Chondrosarcoma (metastatic/recurrent), Grade II; with marked necrosis.

Cell block and cytologic preparations examined.

Comment: The specimen consists of malignant chondrocytes, some with double nuclei, in a chondroid matrix background. Approximately 50% of the tumor cells are non-viable (necrotic). Due to the location of the tumor, clinical correlation is recommended to determine whether this is metastatic or recurrent disease.
Lung, right lower lobe, wedge resection and partial lobectomy:

Metastatic chondrosarcoma, Grade II.

Patient’s history includes chondrosarcoma involving left clavicle with invasion of skeletal muscle, 3.5 cm in largest dimension (6 years ago). Four years ago patient presented with chondrosarcoma, intermediate nuclear grade in left neck resection. The mass was 5.5 cm with lymphovascular invasion.
Lung, right lower lobe, wedge resection: H & E stain, 10x
Lung, right lower lobe, wedge resection: H & E stain, 40x
Neck, left resection: H & E stain, 10x
Neck, left resection: H & E stain, 20x
Chondrosarcoma

- Arise mostly in bone, less often soft tissue
- Produce a chondroid matrix rather than osteoid or bone
- Tumors are aggressive and destructive
- Graded I - III, important in treatment and prognosis
Case 5

65 year-old man presents with abdominal pain
Differential: Solid lesions of the pancreas

- Adenocarcinoma
- Chronic pancreatitis
- Neuroendocrine tumor
- Metastases
- Lymphoma
Octreotide Scan

- Indium 111 labeled pentetreotide aka Octreoscan
- Binds somatostatin receptors, which are found in many neuroendocrine tumors
- Normal uptake in thyroid, liver, gallbladder, spleen, kidneys and bladder
- 5 different subtypes of somatostatin receptors w/ various expression of these receptors on tumors

Liver, ultrasound-guided FNA: Papanicolaou stain, 40x
Liver, ultrasound-guided
FNA, Cell Block, H & E stain, 20x
Liver, ultrasound-guided fine needle aspiration:

Cellular evidence of neuroendocrine neoplasm.

Cell block and cytologic preparations examined.
Liver, left lobe, core needle biopsy:

Well-differentiated neuroendocrine carcinoma.

Comment: The neoplasm is strongly positive for synaptophysin supporting a neuroendocrine derivation. In view of the history of pancreatic mass, the carcinoma is consistent with a metastasis from pancreatic endocrine tumor.
Liver, left lobe, core needle biopsy: H & E stain, 10x
Liver, left lobe, core needle biopsy: H & E stain, 20x
Liver, left lobe, core needle biopsy: Synaptophysin stain, 10x
Pancreatic endocrine tumor

- Tumors of endocrine pancreas arise from stem cells located within the ductal epithelium of the exocrine pancreas
- < 5% of all pancreatic neoplasms
- Commonly located in body or tail
- Slow-growing tumors, most are solitary
- Most tumors occur in adults
Pancreatic endocrine tumor

- Tumors occur in sporadic form or as part of multiple endocrine neoplasia (MEN)1 syndrome.
- Prognosis of patients with pancreatic endocrine tumors is predicted with presence or absence of liver metastases.
Just in case…

- Patrick Swayze - pancreatic adenocarcinoma
- Humphrey Bogart - esophageal carcinoma
- Peter Jennings - bronchogenic carcinoma
- Ted Kennedy Jr. - chondrosarcoma
- Steve Jobs - neuroendocrine tumor of the pancreas
