

**Sant Lab:** The ability of influenza peptides to recruit CD4 into the pathway needed to help antibody responses (“Tfh cells”) is independent of its molecular context. Peptide epitopes from influenza HA (center) or NP (right) were cloned into the heterologous protein MalE (left) and tested for their pattern of CD4 T cell differentiation.

Knowlden, ZA, and Sant, AJ. CD4 T cell epitope specificity determines follicular versus non-follicular helper differentiation in the polyclonal response to influenza infection or vaccination. *Scientific Reports*. 2016; 6:28287
